AI-POWERED STUDENT CAMPUS EXPLORER GAME

Bahareh Einollahi - 810102482
Rayhaneh Einollahi - 810102608

DATE: APRIL 30, 2026

01. EXECUTIVE SUMMARY

The Work Breakdown Structure (WBS) was deliberately crafted to reflect a strategy of parallelization, risk reduction, and feedback-driven efficiency, rather than a rigid, sequential order of tasks. Every major decision in the WBS's design aimed to compress the schedule while preserving quality and adaptability. The following key decisions illustrate why the WBS was structured as it was:

Parallel CV and game development

Both teams begin work in late April and converge by late June, eliminating idle time and saving several weeks.

Asset creation after prototyping

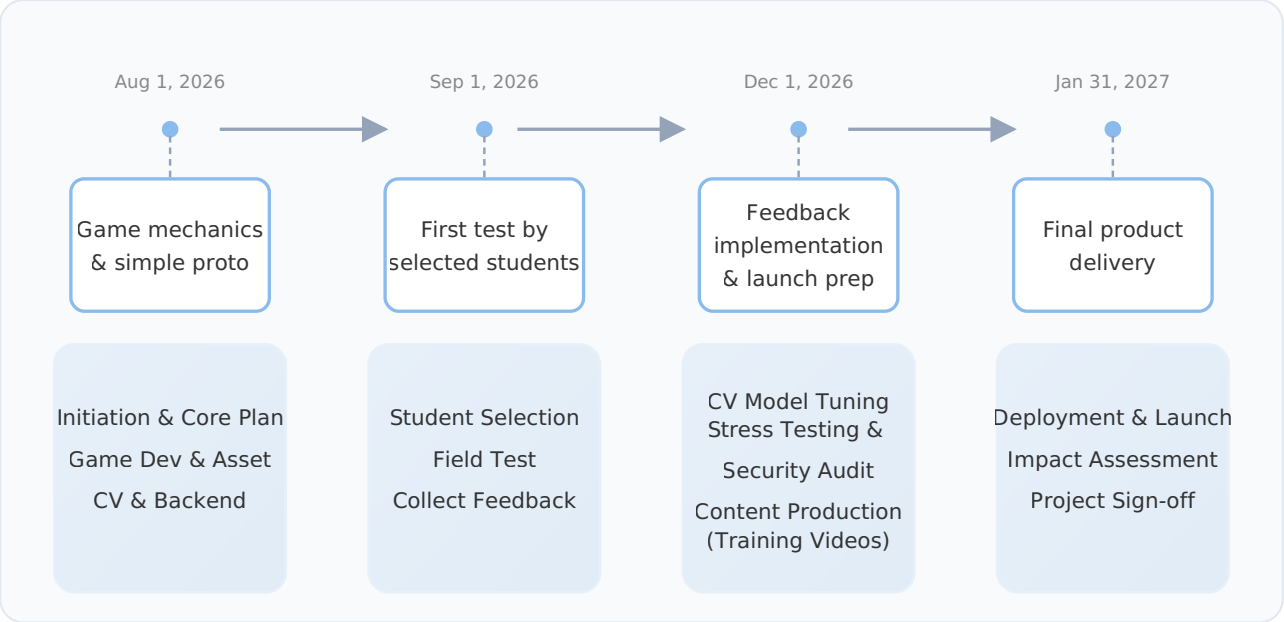

Visual content development begins only once the prototype is stable, reducing rework.

Early student testing before refinement

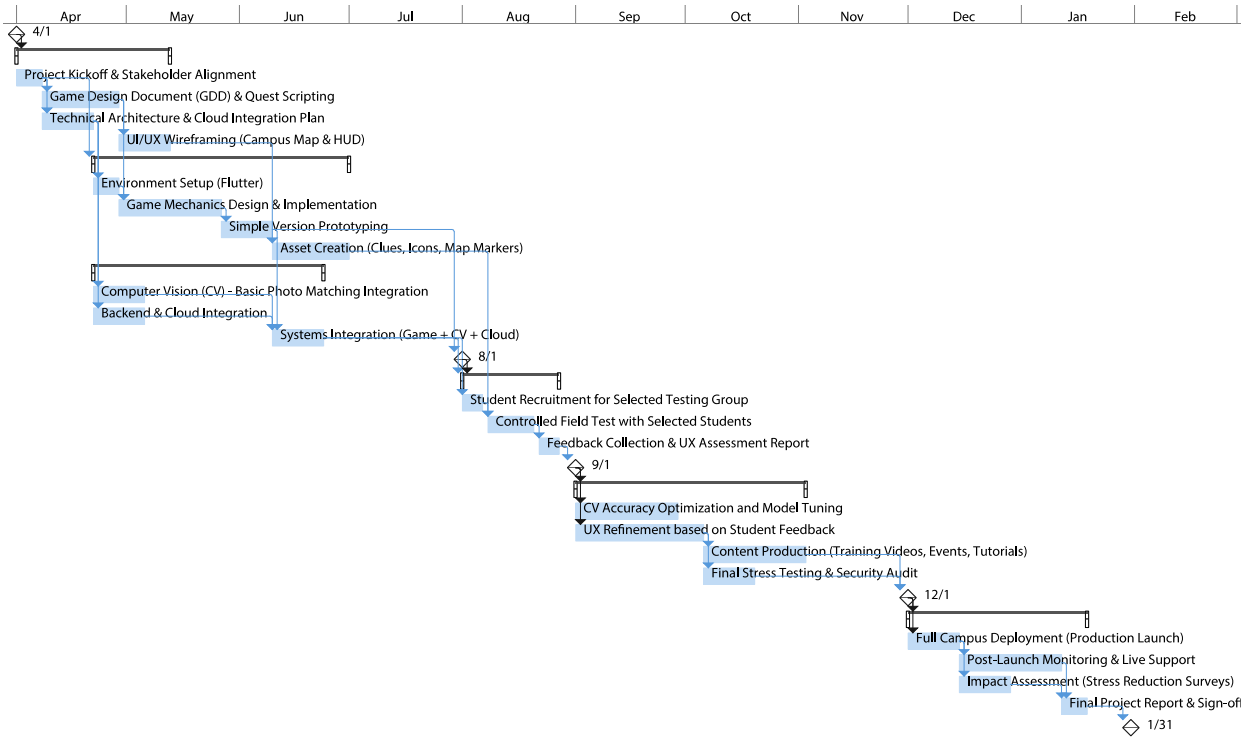

Real user feedback is collected in August, prior to launch, preventing the development of unwanted features.

Separation of UX and CV work

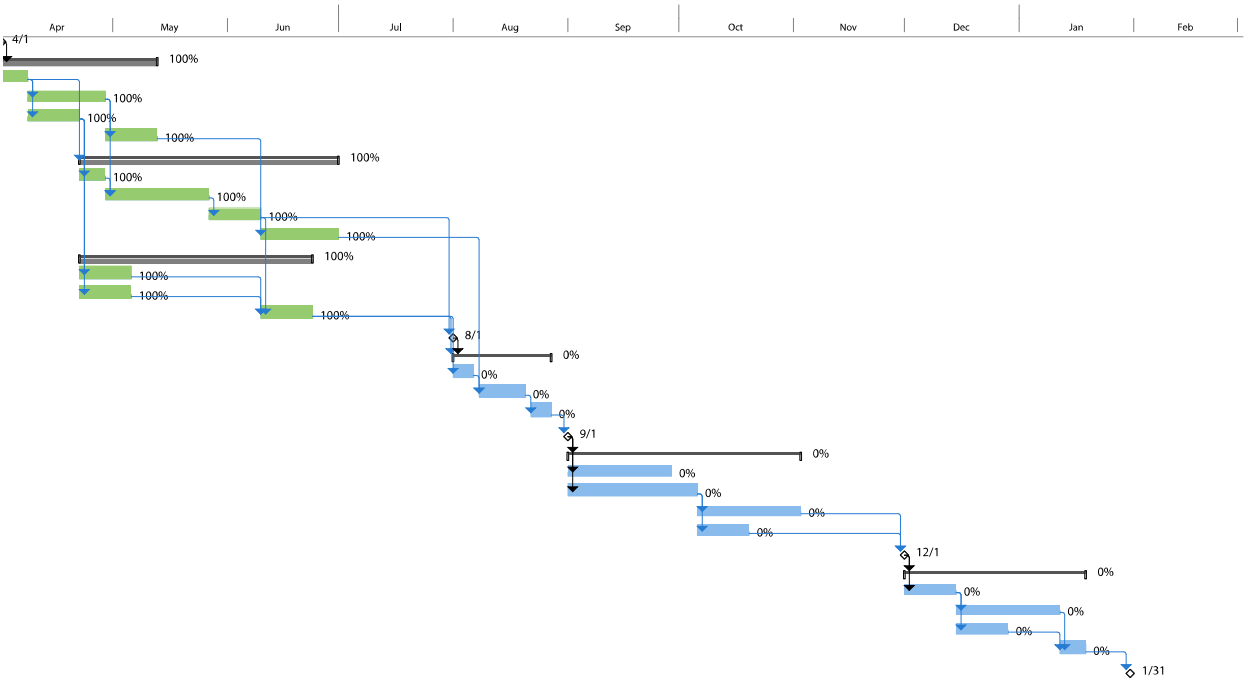

Design improvements proceed independently of technical fixes, allowing both tracks to advance without delay.

03. TRACKING GANTT CHART

04. STRATEGIES TO ENSURE ON-TIME DELIVERY

1

Involve external playtesters from outside the university

Instead of only using university students and staff, recruit schoolchildren visiting for extracurricular activities and pre-Konkour students exploring the university for inspiration. These groups can serve as fresh, unbiased playtesters for early builds — helping identify bugs, difficulty spikes, or unclear mechanics faster than internal testers alone.

2

Use schedule flexibility from the WBS

Our WBS design includes a 5-week flexibility window. This allows us to extend the testing and refinement period if needed, ensuring that "feature creep" or technical bugs do not push back the launch date. We are effectively protected against up to 5 weeks of unforeseen testing delays.

3

Create external motivations for the Tester

To increase student engagement during the testing phase, introduce rewards that come from outside the usual academic or internal project structure:

Public recognition – Display a leaderboard of top testers in the university game lab or on a shared channel.
Exclusive in-game credits – Add a "Special Thanks" section in the game's credits or a hidden room with testers' names.
Small tangible prizes – Offer gift cards, game merchandise, or university swag for weekly testing milestones.
Social media showcase – Highlight top student testers in the university's official newsletter or Instagram with their permission.
